Fluorene-based Alternating Copolymers for
Electroluminescence Element and Electroluminescence Element using
such Copolymers as Light Emitting Materials

5

The present invention relates to fluorene-based alternating copolymers to be used as luminescent materials in manufacturing macromolecular electroluminescence (EL) elements, and relates to EL elements using such fluorene-based alternating copolymers as light emitting materials.

15 Examples of EL elements which have been studied thus far, include inorganic semiconductors such as GaAs which have the advantages of being small in size, require little consumption of electric power, etc., are currently being used as display devices having a small surface area, light emitting diode (LED) lamps, 20 semiconductor lasers, and the like. However, in manufacturing such elements, extremely clean processing is required, and it is difficult to make LEDs of large surface area and it is difficult to obtain blue light having good efficiency. Furthermore, there are inorganic semiconductors having fluorescent ions of metal compounds added thereto, and inorganic EL elements made by 25

dispersing inorganic semiconductors into high molecules, but these cause problems in semiconductor stability not only because they require a high operating voltage but also because they operate under high electric fields.

5 However, as organic EL materials (Appl. Phys. Lett., 51, p.913 (1987)) and macromolecular EL materials (Nature, 347, p.539 (1990)) capable of overcoming such problems are recently being developed, advances in research in this field are continuing to progress. When voltage is applied to an EL element manufactured
10 by depositing organic dyes (Japanese unexamined (laid-open) patent publications 6-136360 and 7-26254), or by putting macromolecules having a conjugate double bond (Int'l patents WO92/03491 and WO93/14177) between an anode and a cathode, holes from the cathode and electrons from the anode are
15 introduced, move to a luminescent layer and emit light when they recombine thereafter. Currently, efforts are being made to find applications of such EL elements for next generation flat panel color display devices, electrochemical cells, image sensors, photocouplers, and the like which use LEDs, which will replace cathode-ray tubes, gas plasma displays, liquid crystal displays
20 used at present.. Elements manufactured by deposition of organic dyes have problems in reproducibility and in making uniform films, and macromolecule-based elements have overcome such problems to a certain degree, but improved stability, efficiency
25 and durability are still required for desired applications to

practical commercial use. Poly(phenylene vinylene) (PPV), polythiophene (PTh) and polyphenylene-based macromolecules (Synth. Met., 50(1-3), p.491 (1992) and Adv. Mater., 4, p. 36 (1992)), are known as representative macromolecular luminescent
5 materials which have been studied up to now, but these materials have the disadvantage that the final material is insoluble in any organic solvent. The processing suitability is improved by introducing appropriate substituents and PPV or PTh derivatives (Synth. Met., 62, p.35 (1994), Adv. Mater., 4, p.36 (1994), and
10 Macromolecules, 28, p. 7525 (1995)) which emit diverse lights of blue, green and red colors are known but the manufacturing process of such derivatives is very complicated, and there are also problems in stability. Moreover, fluorene-based macromolecules which emit blue light (Jpn. J. Appl. Phys., 30,
15 p.L1941 (1991)) have been reported but these have disadvantages in that they can not exhibit various other colors, and require the use of materials and manufacturing methods from which macromolecules with more diversified conjugate double bonds can not be made.

fluorene-based alternating copolymer and macromolecules for general use.

5

The present inventors have created the present invention as a result of their research for manufacturing diverse kinds of macromolecular EL materials which require only a simple manufacturing method, whereby the structure of the final substance is distinct, and being well soluble in any organic solvent.

For manufacturing the macromolecular EL elements according to the present invention, fluorene-based alternating copolymers having the following formula (I) is provided for use as a light emitting material:

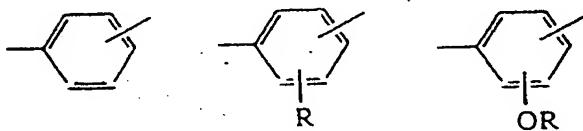

where R and R' may be identical or different, and represent a hydrogen, an aliphatic or alicyclic alkyl or alkoxy group containing 1 to 22 hydrogens or carbons, or an aryl or aryloxy group containing 6 to 18 carbons. For example, R or R' may represent hydrogen, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, pentyl, hexyl, ethylhexyl, heptyl, octyl, nonyl, decyl,

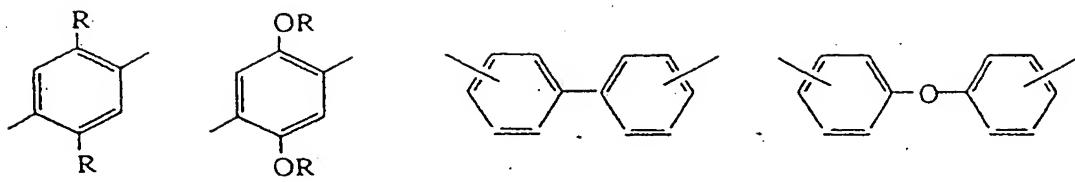

dodecyl, hexadecyl, octadecyl, docodecyl, cyclopropyl,
cyclopentyl, cyclohexyl, ethoxy, butoxy, hexyloxy,
methoxyethoxyethyl, methoxyethoxyethoxyethyl, phenyl, phenoxy,
tolyl, benzyl, naphthyl, anthracene group, etc.; X may represent
5 hydrogen or cyano group; Ar may represent a compound substituted
for aliphatic or alicyclic alkyl or an alkoxy group containing
1 to 22 carbons, phenyl groups in ortho-, meta-, para-positions,
aliphatic or alicyclic alkyl or an alkoxy group containing 1 to
22 of carbons, such as dialkyl and a dialkoxyphenyl group,
10 compounds of diphenyl, diphenylether, diphenylsulfide, and
diphenylamine of various isomers, compounds having two or more
phenyl groups, such as fluorene, terphenyl, naphthalene,
anthracene, and derivatives thereof, compounds having hetero
atoms, such as pyridine, furan, thiophene, alkylthiophene,
15 dithiophene, pyrrole, dipyrrole, dipyrromethane, dibenzofuran,
dibenzothiophene, diphenyloxadiazole, diphenylthiadiazole,
carbazole, and derivatives thereof, compounds of diphenylmethane
or diphenylsilane, and compounds of bisformylphenoxyalkanes or
alkoxy of various isomers; and n represents an integer greater
20 than or equal to 1.

For reference, the said Ar groups can be illustrated as follows:

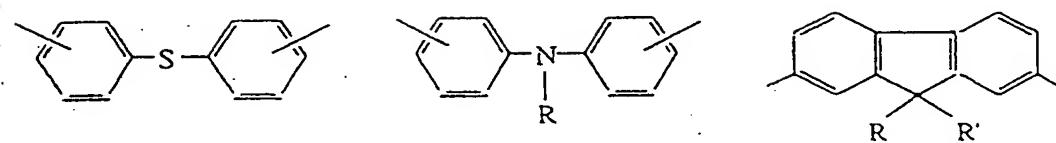

- Ar - = - (CH₂)_n -

25

13

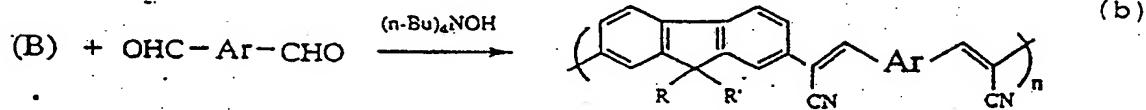

The polymerization degree and the manufacturing method of the polymers used in the present invention need not be particularly restricted. For instance, since such polymers are soluble in any organic solvent, the polymerization degree is generally 1 to 2,000, and preferably 3 to 1,000, to the extent that a film is formed by a spin coating or casting method. As examples of the manufacturing method of copolymers having conjugate double bonds, the present invention may employ known methods such as the Wittig reaction as shown in the following reaction formula (a) (J. Am. Chem. Soc., 82, p.4669, (1960), Org. React., 25, p.73, (1977)), the Knoevenagel condensation method as shown in the reaction formula (b) (J. Org. Chem., 25, p.813, (1960), Macromolecules, 27, p.3009, (1994)), the Heck reaction method by means of a palladium catalyst as shown in the reaction formula (c) (Org. React., 27, p.345, (1982), Macromolecules, 28, p.6410, (1995)), the method using a precursor as shown in the reaction formula (d) (U.S. Patent 3,401,152, J. Chem. Soc., Chem. Commun., p.32, (1992), Science, 269, p.376, (1995)), and the reaction using a strong base such as potassium-tert-butoxide as shown in the reaction formula (e) (J. Polym. Sci., Part A-1, 4, p.1337 (1966), Synth. Met., 62, p.35 (1994)).

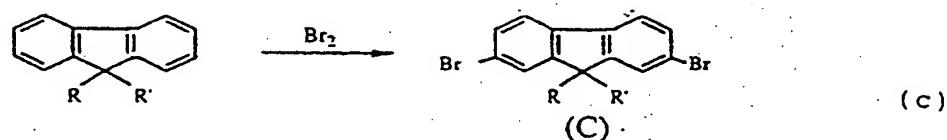

10

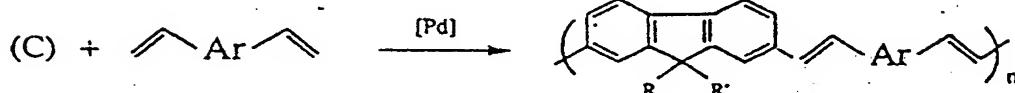

15

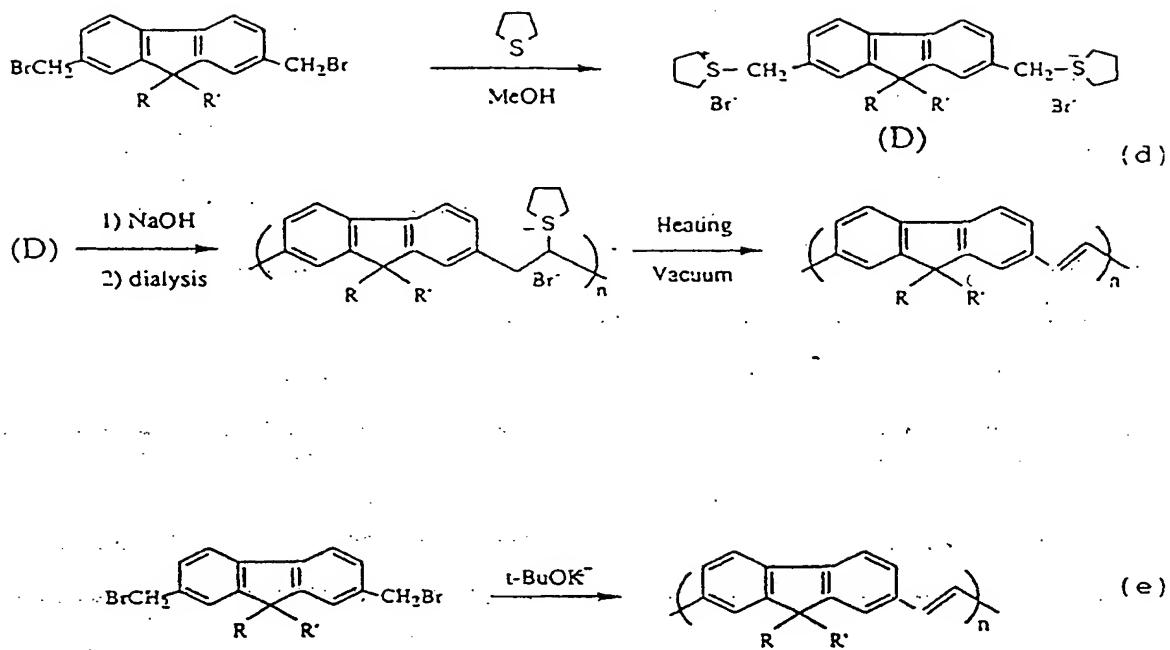

20

25

Explaining each formula in more detail, the monomers used in the Wittig polymerization are generally phosphonium salt and dicarboxaldehyde, which are reacted with a strong basic catalyst, such as sodium or alkyl lithium using an organic solvent, such as ethanol. According to the present invention, bis-bromo (or chloro) methyl fluorene phosphonium or fluorene-substituted phosphonium, and various dicarboxaldehydes may be used, whereby all fluorene-based phosphonium salts and all aliphatic, alicyclic and aromatic dicarboxaldehydes that are capable of formulating the formula (I) after polymerization are included. Specific examples of fluorene-based phosphonium salts include phosphonium salts having an aliphatic (or alicyclic) alkyl group or an aliphatic (or alicyclic) alkoxy group having 1 to 22 carbons in place of one hydrogen at the 9 position, or phosphonium salts

20

25

having an aryl or aryloxy group having 6 to 18 carbons in place of one hydrogen at the 9 position, for example, 2,7-bis (bromomethyl) fluorene triphenyl phosphonium salt or 2,7 bis (bromomethyl)-9-alkyl (alkoxy or aryl) fluorene triphenyl phosphonium salt; and phosphonium salts having an aliphatic (or alicyclic) alkyl group or an aliphatic (or alicyclic) alkoxy group having 1 to 22 carbons in place of two hydrogens at the 9 position, or phosphonium salts having an aryl or aryloxy group having 6 to 18 carbons in place of two hydrogens at the 9 position, for example, 2,7-bis (bromomethyl)-9,9'-dialkyl (alkoxy or aryl) fluorene triphenyl phosphonium salts.

Dicarboxaldehydes include, aliphatic dicarboxaldehydes such as glutaldehyde; unsubstituted aromatic dicarboxaldehydes such as phthaldehyde, isophthaldehyde, and terephthaldehyde; aromatic dicarboxaldehydes having an aliphatic (or alicyclic) alkyl group or an aliphatic (or alicyclic) alkoxy group having 1 to 22 carbons, or having an aryl or aryloxy group having 6 to 18 carbons, such as 1,4-dialkyl (alkoxy or aryl) phenyl-2,5-dicarboxaldehyde; diformyl diphenyl derivatives, 2,7-diformyl fluorene derivatives, ortho- or metha- or para-terphenyl diformyl compounds, such as 2,2'- or 3,3'- or 4,4'-diphenyl dicarboxaldehyde or bis(2-or 3-or 4-formyl phenyl)ether or sulfide or alkylamine; naphthalene dicarboxaldehyde compounds such as 1,8- or 2,6-naphthalene dicarboxaldehyde; anthracene dicarboxaldehyde compounds such as

1,8- or 9,10-anthracene dicarboxaldehyde; 2,6-pyridine dicarboxaldehyde, 2,5-furane dicarboxaldehyde, 2,5-thiophene dicarboxaldehyde, 5,5'-diformyl-2,2'-dithiophene, 3-alkyl-2,5-thiophene dicarboxaldehyde, 2,5-pyrrole dicarboxaldehyde, N,N'-dipyrrole methane-2,2'-dicarboxaldehyde, 2,8-dibenzofuran dicarboxaldehyde, 2,8-dibenzothiophene dicarboxaldehyde, 2,5-bis(2- or 3- or 4-formylphenyl)-1,3,4-diphenyl thiadiazole, and diformylcarbazoles substituted with aliphatic or alicyclic alkyl group having 1 to 22 carbons, such as N-alkyl-3,6-diformylcarbazole.

Monomers used in the Knoevenagel condensation method related to the present invention are bis(bromomethyl) fluorene and its derivatives and dicarboxaldehyde compounds. In lieu of bis(bromomethyl) fluorene and its derivatives, bis(cyanomethyl) fluorene and its derivatives obtained by reaction with cyanide compounds such as sodium cyanide can be used, and the dicarboxaldehyde compounds of the Wittig polymerization can also be used as is in the present invention. The polymerization is carried out by reacting these two compounds using an organic solvent such as tetrahydrofuran or toluene, in the presence of a strong basic catalyst, such as tetrabutylammonium hydroxide or potassium-tert-butoxide.

In the Heck reaction method using a palladium catalyst, aromatic dibromide or diiodide and divinyl compounds are subject

to a condensation reaction together with amine compounds such as palladium acetate, tri-o-tolylphosphine and tributylamine, in the presence of a basic solvent such as dimethylformamide. Thus, dibromide or diiodide derivatives obtained by adding bromine or 5 iodic acid to the said fluorene derivatives may be used as aromatic dibromide or diiodide compounds related to the present invention. For example, if fluorene or 9-alkyl or 9,9'-dialkyl fluorene is treated with bromine in the presence of dimethylformamide or chloroform solvent, 2,7-dibromo fluorene or 10 an alkyl group substituted fluorene compound may be obtained. The aromatic divinyl compound may be obtained by subjecting the dicarboxaldehyde compounds such as metha-divinylbenzene, para-divinylbenzene, 2,2'- or 3,3'- or 4,4'-divinyl diphenyl, 2,5-divinyl thiophen, 2,6-divinyl naphthalene, etc. to the Wittig 15 reaction.

In connection with the present invention, a method using a precursor can be employed to easily obtain tetrahydrothiophene salt by reacting bis(chloro or bromomethyl) fluorene and its derivatives with tetrahydrothiophene in the presence of methanol. Consequently, the bis(chloro or bromomethyl) fluorene and its 20 derivatives used in the Wittig polymerization may be used for the reaction as is. When the thusly obtained salts are polymerized in water or methanol solvent, and then dialyzed and heated in a vacuum, the polymer of the present invention can be obtained.

25 The polymers related to the present invention can be easily

obtained by reacting the bis(chloro or bromomethyl) fluorene and its derivatives with a strong base such as potassium-tert-butoxide or normal-butyllithium, in the presence of toluene or tetrahydrofuran solvent. Accordingly, the 5 bis(chloro or bromomethyl) fluorene and its derivatives may be used as a monomer.

The constitution of EL elements using fluorene-based macromolecules according to the present invention, includes a general element constitution in which the material of the present 10 invention is inserted between an anode and a cathode, that is, an element constitution of anode / luminescent layer / cathode, and also can additionally use the known hole or electron transporting layer materials (Japanese unexamined (laid-open) patent applications 2-135361, 3-152184, 6-207170) and the possible 15 element constitutions are not particularly limited. In other words, a constitution of anode/hole transporting layer / luminescent layer / electron transporting layer / cathode would also be included. An anode ordinarily comprise a transparent supporting substrate such as glass, transparent plastics, quartz, etc. with a metal or metal oxide such as ITO, gold, copper, tin oxide, zinc oxide, etc. as electrode materials or an organic semiconductor compound such as polypyrrole, polyaniline or polythiophene coated to a thickness of 10 nanometers to 1 micron thereon. A cathode is usually made of a metal such as sodium, 20 magnesium, calcium, aluminum, indium, silver, gold, copper, etc.,

or alloy metals thereof. The hole transporting layer can be formed by coating with polyvinylcarbazole, 2,5-bis(4'-diethylaminophenyl)-1,3,4-oxadiazole, N,N'-diphenyl-N,N'-(3-methylphenyl)-1,1'-biphenyl-4,4'-diamine(TPD), etc., while the electron transporting layer can be formed with the known compounds such as tris (8-hydroxyquinolinato) aluminum, 2-(4'-fert-butylphenyl)-5-(4"-biphenyl)-1,3,4-oxadiazole, 2,4,7-trinitro-9-fluorenone, etc., employing known film formation methods, such as vacuum deposition, spin coating, casting, LB method, etc.

The luminescent polymers of the present invention can also be used by blending with the hole or electron transporting layers or other mutually different polymers of the present invention, and existing luminescent polymers such as soluble PPV or PTh derivatives. For instance, polyvinylcarbazole, poly(1,4-hexyloxy-2,5-phenylenevinylene)poly(3-hexylthiophene), etc. and the fluorene-based macromolecules of the present invention are dissolved in an organic solvent such as chloroform and then coated by spin coating, casting method, etc. Although no particular restrictions are required, it is desirable to use the fluorene-based macromolecules of the present invention in a concentration of more than 0.001 % by weight, preferably 0.1 to 50% by weight to polyvinylcarbazole, and the film in thickness of 5 nanometers to 5 microns, preferably 50 nanometers to 1 micron. Furthermore, macromolecules that are soluble in any general organic solvent and that are capable of forming into a film

structure even though such macromolecules do not form a hole or electron transporting layer, may be used by blending them in the same concentration and thickness mentioned above. Macromolecules which can be used include thermoplastics, such as 5 polymethylmethacrylate, polyacrylate, polystyrene, polycarbonate, polyvinylchloride, polyethylene, polypropylene, polyacrylonitrile, polyvinylpyrrolidone, polyvinylalcohol, polyvinylacetate, polyvinylbutyral, polyvinylamine, polycaprolacton, polyethyleneterephthalate, polybutyleneterephthalate, polyurethan, ABS, polysulfone, polyvinylfluoride, etc., or resins for general use, such as acetal, polyamides, polyimides, polyester, alkyd, urea, furan, nylon, melamine, phenol, silicon, epoxy, etc.

15 The present invention is hereinafter described in details by examples which are not limitative.

Example:

Synthesis of monomers

Monomers to be used in the present invention are not required to be particularly restricted. For example, any monomer will do as long as the polymer formed after polymerization is a macromolecule satisfying the formula (I). Even though it is not specifically mentioned in the following descriptions, compounds that can be easily synthesized in general, that are already well known or which are similar, or monomers that are commercially 20 25

available were synthesized employing already known or similar methods, or purchased for manufacturing the polymers of the present invention.

Synthesis of 2,7-bis(bromomethyl)-9-normal-hexylfluorene

In a 1L three-neck flask equipped with a stirrer, a thermometer and a reflux condenser, 50.0 g (0.2 mol) of 9-normal-hexyl fluorene, 60 g (2.0 mol) of paraformaldehyde, and 500 g of 30% HBr acetic acid solution were introduced, and reacted for 24 hours at a temperature of 60°C. When the temperature is decreased to room temperature after reaction, a soft yellow solid is obtained. This solid was filtered, washed several times with water and methanol, and then dried sufficiently in a vacuum oven at a temperature of 40°C. As a result, 74 g (yield: 85%) of a white solid having a melting point of 143°C to 145°C was obtained. [¹H-NMR(CDCl₃), δ 0.88 (t, 3H, CH₃), 1.25 (m, 8H, CH₂), 2.01 (m, 2H, CH₂), 3.98 (t, 1H, CH), 4.63 (s, 4H, CH₂Br), 7.39-7.72 (m, 6H, aromatics)].

Synthesis of 2,7-bis(bromomethyl)-9-normal-hexylfluorene triphenylphosphonium salt

In a 1L three-neck flask equipped with a stirrer, a thermometer and a reflux condenser, 43.6 g (0.1 mol) of 2,7-bis(bromomethyl)-9-normal-hexylfluorene, 78.7g (0.3 mol) of triphenylphosphine, and 500 ml of dimethylformamide were introduced and reacted for 12 hours at reflux temperature. When

the temperature was decreased to room temperature after reaction, and the reaction solution was dropped down slowly into a 3L ethylether solvent being thoroughly stirred, to obtain a white solid. After filtering, this solid was washed several times with 5 ethylether, and then dried sufficiently in a vacuum oven at a temperature of 40°C. As a result, 92.2 g (yield: 96%) of a white solid was obtained. [¹H-NMR (CDCl₃), δ 0.25(br, 3H, CH₃), 1.60-1.24(m, 10H, CH₂), 2.83(t, 1H, CH), 5.66-5.76(d, 4H, CH₂Br), 6.76-7.11(m, 6H, aromatic fluorenyl), 7.49-7.81(m, 30H, 10 aromatic)].

Synthesis of 2,7-bis(bromomethyl)-9,9'-di-normal-hexyl fluorene

In a 1L three-hole flask equipped with a stirrer, a 15 thermometer and a reflux condenser, 33.4g (0.1 mol) of 9,9'-di-normal-hexylfluorene, 30g (1.0 mol) of paraformaldehyde, 300g of 30% HBr acetic acid solution, and 120g of 48% HBr aqueous solution were introduced and reacted for 24 hours at a 20 temperature of 60°C. The temperature was decreased to room temperature and the resultant was diluted with 500ml of cold water, and then extracted three times with 200ml of dichloromethane. The extracted organic solutions were combined, and then washed consecutively with water, saturated NaHCO₃ aqueous solution and salt water. The resultant organic solution 25 was dried with anhydrous magnesium sulfate, and after filtering

and evaporating the solvent, a viscous liquid was obtained. Such liquid was purified using a silica gel column (ethylacetate/hexane = 1/10 mixed solvent), and then evaporated to obtain 44.2g (yield: 85%) of a colorless transparent viscous liquid.

5 [¹H-NMR(CDCl₃), δ: 0.59(br, 6H, CH₃), 0.72-1.04(m, 16H, CH₂), 1.95(m, 4H, CH₂), 4.60(s, 4H, CH₂Br), 7.33-7.62(m, 6H, aromatic)].

Synthesis of 2,7-bis(bromomethyl)-9,9'-di-normal-hexyl fluorene triphenylphosphonium salt

10 In a 1L three-hole flask equipped with a stirrer, a thermometer and a reflux condenser, 26.0g (0.05 mol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexylfluorene, 39.3g(0.15 mol) of triphenylphosphine, and 300ml of dimethylformamide were introduced and reacted for 12 hours at reflux temperature. After 15 reaction, the temperature was decreased to room temperature, and the reaction solution was dropped down slowly in a 1.5L ethylether solvent being thoroughly stirred, to obtain a white solid. After filtering, such solid was washed several times with ethylether and dried sufficiently in a vacuum oven at a 20 temperature of 40°C. As a result, 49.6g (yield: 95%) of a white solid was obtained. [¹H-NMR(CDCl₃), δ: 0.11(br, 6H, CH₃), 0.62-1.09(m, 16H, CH₂), 1.39(m, 4H, CH₂), 5.21-5.28(d, 4H, CH₂Br), 6.83-7.27(m, 6H, fluorenyl aromatic), 7.54-7.75(m, 30H, aromatic)].

Synthesis of 2,7-bis(cyanomethyl)-9-normal-hexylfluorene

Under nitrogen atmosphere, 300ml of purified dimethylsulfoxide and 2.8g (0.057 mol) of sodium cyanide were put in a 500ml three-neck flask equipped with a stirrer, a thermometer and a reflux condenser, and heated at a temperature of 90°C with agitation. When the sodium cyanide was completely dissolved, the heating was ceased, and 10g (0.023 mol) of 2,7-bis(bromomethyl)-9-normal-hexylfluorene was added slowly. This reactant was reacted for 12 hours at a temperature of 90°C. At that time, the color of the reactant first changed into red, and then gradually became deep dark brown. After reaction, the temperature was decreased to room temperature, 500ml of distilled water was added, the reactant was extracted three times with 200ml of dichloromethane, the extracted organic solvents were combined, and then dried sufficiently using magnesium sulfate anhydride. After filtering such solution and evaporating the solvent, a solid of orange color was obtained. Recrystallization of such solid using ethylacetate/hexan (1 : 1) resulted in 5.7g (yield: 76%) of a solid having a melting point of 130°C to 131°C [¹H-NMR (CDCl₃), δ 0.89(t, 3H, CH₃), 1.25(m, 8H, CH₂), 2.04(m, 2H, CH₂), 3.90(s, 4H, CH₂CN), 4.02(t, 1H, CH), 7.35-7.79(m, 6H, aromatic)].

Synthesis of 2,7-dibromo-9,9'-di-normal-hexylfluorene

Under nitrogen atmosphere, 33.4g (0.1 mol) ... of

9,9'-di-normal-hexylfluorene was put in a 500ml three-neck flask equipped with a stirrer, and after dissolving it with 300ml of purified dimethylformamide, 48g (0.3 mol) of bromine was added slowly. This reactant was reacted for 12 hours at room temperature, added into 500ml of water, and extracted three times with 200ml of diethylether. The organic solvents were put together, washed consecutively with sodium thiosulfate aqueous solution and salt water, and after separating the organic layer, the resultant was dried sufficiently using magnesium sulfate anhydride. With filtering such solution and evaporating the solvent, a light yellow solid was obtained, and as a result of recrystallization with hexan, 43.8g (yield: 89%) of a white crystal solid having a melting point of 61°C to 62°C was obtained. [¹H-NMR (CDCl₃), δ 0.55(br, s, 6H, CH₃), 0.73-1.03(m, 16H, CH₂), 1.90-1.94(m, 4H, CH₂), 7.41-7.53(m, 6H, aromatic)].

Synthesis of 2,7-bis(bromomethyl)-9-(2-[2-(2-methoxyethoxyethoxy]ethyl) fluorene

In a 1L three-hole flask equipped with a stirrer, a thermometer and a reflux condenser, 31.2g (0.1 mol) of 9-methoxyethoxyethoxyethylfluorene, 30g (1.0 mol) of paraformaldehyde, 300g of 30% HBr acetic acid solution, and 120g of 48% HBr aqueous solution, were introduced and reacted for 24 hours at a temperature of 60°C. After reaction, the temperature was decreased to room temperature, and the reactant was diluted

with 500ml of cold water, and then extracted three times with 200ml of dichloromethane. The extracted organic solutions were combined and washed consecutively with water, saturated NaHCO₃ aqueous solution, and salt water. The resultant organic solution was dried with magnesium sulfate anhydride, and after filtering and evaporating the solvent, a light yellow viscous liquid was obtained. After refining the liquid using silica gel column (ethylacetate/hexan = 1/4 mixed solvent), and evaporating the solvent, 39.8g (yield: 80%) of a colorless transparent viscous liquid was obtained. [¹H-NMR (CDCl₃), δ 2.28(m, 3H, OCH₃), 3.41-3.71(m, 12H, OCH₂CH₂), 4.09(t, 1H, CH), 4.60(s, 4H, CH₂Br), 7.25-7.71(m, 6H, aromatic)].

Synthesis of 2,7-bis(bromomethyl)-9-{2-[2-(2-methoxyethoxy)ethoxy]ethyl} fluorene triphenylphosphonium salt.

In a 1L three-hole flask equipped with a stirrer, a thermometer and a reflux condenser, 24.9g (0.05 mol) of 2,7-bis(bromomethyl)-9-{2-[2-(2-methoxyethoxy)ethoxy]ethyl} fluorene, 39.3g (0.15 mol) of triphenylphosphine, and 300ml of dimethylformamide were introduced and reacted for 12 hours at reflux temperature. After reaction, the temperature was decreased to room temperature, and the reactant was dropped down slowly in 1.5L of ethylether solvent under agitation, to obtain a white solid. After filtering, such extracted solid was washed several times with ethylether, and then dried sufficiently in a

vacuum oven at 40°C. As a result, 48.5g (yield: 95%) of a white solid was obtained. [¹H=NMR (CDCl₃), δ 1.22-1.41(m, 2H, -CH₂), 2.16-2.42(br, s, 3H, OCH₃), 3.41-3.71(m, 10H, OCH₂CH₂), 4.18(t, 1H, CH), 5.58-5.81(d, 4H, CH₂Br), 6.81-7.22(m, 6H, fluoreyl aromatic), 7.27-7.84(m, 30H, aromatic)].

5
Synthesis of N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl)-3,6-diformyl carbazole

Under nitrogen atmosphere, 191g (2.61 mol) of 10 dimethylformaldehyde and 100ml of 1,2-dichloroethane were put in a 1L three-hole flask provided with an agitator, a thermometer, and a reflux condenser, and after cooling the mixture sufficiently to the temperature of 0°C, 197.6g (1.29 mol) of phosphorous oxychloride was dropped down slowly thereto. The 15 temperature of the reactant was raised to room temperature, and then the reactant was agitated for 1 hour, recooled to 0°C and 21.0 g (0.067 mol) of N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl) carbazole diluted with 30ml of 1,2-dichloroethan was added slowly thereto. After 1 hour, the reaction temperature was raised to 20 90°C and the reaction was carried out for 24 hours. After reaction, the temperature was dropped to room temperature, and the reactant was diluted with 1.5L of ice water, and then was extracted three times with 200ml of dichloromethane. The extracted organic solutions were combined, and then washed 25 consecutively with water, saturated NaHCO₃ aqueous solution, and

salt water. The resultant solution was dried with anhydrous magnesium sulfate, and after filtering and evaporating the solvent, a yellow viscous liquid was obtained. Such liquid was recrystallized three times with a small amount of ethylacetate, and 11.1g (yield: 45%) of a light yellow solid having the melting point of 108°C to 109°C was obtained. [¹H-NMR (CDCl₃), δ 3.48-3.56 (m, 11H, OCH₂ and OCH₃), 3.98(t, 2H, OCH₂), 4.61(t, 2H, NCH₂), 7.62(d, 2H, aromatic), 8.13(d, 2H, aromatic), 8.68(s, 2H, aromatic), 10.15(s, 2H, CHO)].

10

Synthesis of polymers

Example 1:

Synthesis of poly(2,7-fluorendiylvinylene-alt-3,6-N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl) carbazoylene vinylene)

Under nitrogen atmosphere, 1.75g (2 mmol) of 2,7-bis(bromomethyl) fluorene triphenyl phosphonium salt and 0.75g of N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl)-3,6-diformyl carbazole were put in a 100 ml flask containing a stirrer, and after dissolving them with 60ml of anhydrous ethanol and 20ml of chloroform, 2.3 g of solution of anhydrous ethanol in which 5% of sodium is dissolved, was taken by an injector, and then slowly introduced dropwise in such solution. After reaction for 12 hours at room temperature, 1 ml of 0.1 N aqueous hydrochloric acid solution was added thereto, and the reaction was ceased, and then a solid precipitated was filtered. The resultant solid was

washed with methanol, and dried sufficiently in a vacuum oven at 40°C. As a result, 0.82g of the title polymer as a yellow solid was obtained. The weight average molecular weight and molecular weight distribution of such polymer was obtained by using polystyrene reference substance in the presence of tetrahydrofuran, and the result was 2,700 and 1.69, respectively.

[¹H-NMR (CDCl₃), δ 3.3-4.0(br, d, fluorene-CH₂ and carbazole-alkoxy), 4.3-4.6(br, s, NCH₂), 6.5-8.4(br, m, vinyl and aromatic)].

10

Example 2:

Synthesis of poly(9-normal-hexyl-2,7-fluorendiylinylene -alt-3,6-N-{2-[2-(2-methoxyethoxy)ethoxy]ethyl} carbazoylene vinylene)

15 1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-hexyl fluorene triphenylphosphonium salt and 0.74g (2 mmol) of N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl)-3,6-diformyl carbazole were polymerized by the same method as in Example 1, and 0.86 g of the titled polymer as a yellow solid was obtained. The weight average molecular weight and the molecular weight distribution were 5,900 and 1.87, respectively. [¹H-NMR (CDCl₃), δ 0.6-2.2(br, m, fluorene-aliphatic), 3.4-4.0(br, d, CH and fluorene and carbazole-alkoxy), 4.3-4.6(br, s, NCH₂), 6.6-8.3(br, m, vinyl and aromatic)].

25

Example 3:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediy1 vinylene-alt-3,6-N-[2-[2-(2-methoxyethoxy)ethoxy]ethyl]carbazoylene vinylene)

5 2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexylfluorenetriphenyl-phosphonium salt and 0.74g (2 mmol) of N-[2-[2-(2-methoxyethoxy)ethoxy]ethyl]-3,6-diformyl carbazole were polymerized by the same method as in Example 1, and 0.92 g of the titled polymer as yellow solid was obtained. The weight average molecular weight and the molecular weight distribution 10 were 11,400 and 2.04, respectively. [¹H-NMR (CDCl₃), δ 0.6-2.2 (br, m, fluorene-aliphatic), 3.3-3.9(br, m, and carbazole-alkoxy), 4.3-4.6(br, s, NCH₂), 6.6-8.4(br, m, vinyl and aromatic)].

15

Example 4:

Synthesis of poly(9-[2-[2-(2-methoxyethoxy)ethoxy]ethyl]-2,7-fluorendiy1vinylene-alt-3,6-N-[2-[2-(2-methoxyethoxy)ethoxy]ethyl] carbazoylene vinylene)

20 2.05g (2 mmol) of 2,7-bis(bromomethyl)-9-[2-[2-(2-methoxyethoxy)ethoxy]ethyl] fluorene triphenylphosphonium salt and 0.74g (2 mmol) of N-[2-[2-(2-methoxyethoxy)ethoxy]ethyl]-3,6-diformyl carbazole were polymerized by the same method as in Example 1, and 0.81g of the titled polymer as a 25 yellow solid was obtained. The weight average molecular weight

and the molecular weight distribution were 2,900 and 1.41, respectively. [¹H-NMR (CDCl₃), δ 2.1-2.4 (br, s, fluorene-CH₂), 3.2-3.9(br, m, fluorene-CH and fluorene and carbazole-alkoxy), 4.3-4.6(br, s, NCH₂), 6.5-8.4(br, m, vinyl and aromatic)].

5 Example 5:

Synthesis of poly(9-normal-hexyl-2,7-cyanofluorenylidene-3,6-N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl) carbazole)

10 Under nitrogen atmosphere, 0.66g (2 mmol) of 2,7-bis(cyanomethyl)-9-normal-hexyl fluorene and 0.74g (2 mmol) of N-(2-[2-(2-methoxyethoxy)ethoxy]ethyl)-3,6-diformyl carbazole were put in a 100ml flask equipped a stirrer, and after dissolving completely in 20ml of purified tetrahydrofuran, it was cooled to the temperature of -78°C. 0.04ml of tetra-normal-butylammonium hydroxide solution diluted to a degree of 1.0 mol, was taken and dropped down by a micro injector. After 30 minutes, the temperature was increased slowly up to 50°C and the reaction was carried out for 12 hours. The reaction was ceased by putting 1 ml of 0.1 hydrochloric normal aqueous solution, and by putting the reaction solution in 250ml of methanol, the polymer was isolated. The resultant polymer was washed well with methanol, and dried sufficiently in a vacuum oven at 40°C, and then 0.80g of the titled polymer was obtained as a yellow solid. The weight average molecular weight and the

molecular weight distribution of such polymer were weighed by using polystyrene reference substance, in the presence of tetrahydrofuran solvent, and were found to be 38,700 and 4.28, respectively. [¹H-NMR (CDCl₃), δ 0.5-2.1(br, m, fluorene-aromatic), 3.2-4.0(br, m, fluorene-CH and fluorene and carbazole-alkoxy), 4.3-4.6(br, s, NCH₂), 6.5-8.2(br, m, vinyl and aromatic)].

5 Example 6:

10 Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorene diylvinylene-alt-meta-phenylene vinylene)

Under nitrogen atmosphere, 0.98g (2 mmol) of 2,7-dibromo-9,9'-di-normal-hexylfluorene, 0.26g (2 mmol) of meta-divinylbenzene, 18.2mg of palladium acetate, and 124mg of tri-ortho-tolylphosphine were put in a 100ml flask equipped with a stirrer, and after dissolving completely in 15ml of purified dimethylformamide, 1.4ml of tributylamine was taken and dropped down by injector. After 30 minutes, the temperature was raised slowly to 100°C and the reaction was carried out for 24 hours and ceased by adding 1 ml of 0.1 hydrochloric normal aqueous solution, and then the reaction solution was put slowly in 250ml of methanol to isolate a polymer. The resultant polymer was washed well with methanol, and dried sufficiently in a vacuum oven at 40°C, and as a result, 0.81g of the titled polymer was obtained as a yellow solid. The weight average molecular weight

and the molecular weight distribution was then measured by GPC using polystyrene reference substance, in the presence of tetrahydrofuran solvent, and the result was 35,400 and 3.21, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.2(br, m, aromatic), 5 6.5-7.8(br, m, vinyl and aromatic)].

Example 7:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorene diylvinylene-alt-para-phenylene vinylene)

0.98g (2 mmol) of 2,7-dibromo-9,9'-di-normal-hexylfluorene and 0.26g (2 mmol) of para-divinylbenzene were polymerized by the same method as in Example 6, and 0.85g of the titled polymer was obtained as a yellow solid. The weight average molecular weight and the molecular weight distribution were 26,300 and 2.89, respectively. [¹H-NMR (CDCl₃), δ 0.5-2.2(br, m, aliphatic), 6.5-7.8(br, m, vinyl and aromatic)].

Example 8:

Synthesis of poly(9-normal-hexyl-2,7-fluorendiylyvinylene -alt-para-phenylene vinylene)

1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-hexyl fluorene triphenyl phosphonium salt and 0.27 g (2 mmol) of terephthalaldehyde were polymerized by the same method as in Example 1, and as a result, 0.62g of the titled polymer was obtained as a yellow solid. The weight average molecular weight

and the molecular weight distribution were 7,200 and 3.41, respectively. (¹H-NMR (CDCl₃), δ 0.7-2.1(br, m, aromatic), 3.7-4.0(br, s, fluorene - CH), 6.5-7.8(br, m, vinyl and aromatic)].

5

Example 9:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorendiyl vinylene-alt-para-phenylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal
10 -hexylfluorenetriphenylphosphonium salt and 0.27g (2 mmol) of terephthalaldehyde were polymerized by the same method as Example 1, and as a result, 0.68g of the titled polymer was obtained as a yellow solid. The weight average molecular weight and the molecular weight distribution were 38,200 and 4.45, respectively.
15 [¹H-NMR (CDCl₃), δ 0.5-2.2(br, m, aliphatic), 6.5-7.8(br, m, vinyl and aromatic)].

Example 10:

Synthesis of poly(9-normal-hexyl-2,7-fluorendiyl vinylene-alt-meta-phenylene vinylene)

1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-hexyl
fluorene triphenylphosphonium salt and 0.27g (2 mmol) of isophthalaldehyde were polymerized by the same method as in Example 1, and as a result, 0.64g of the titled polymer was obtained as a pale yellow solid. The weight average molecular
25

weight and the molecular weight distribution were 12,700 and 5.01, respectively. [¹H-NMR (CDCl₃), δ 0.6-2.2(br, m, aromatic), 3.6-4.0(br, s, fluorene - CH), 6.4-7.8(br, m, vinyl and aromatic)].

5

Example 11:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorendiyl vinylene-alt-meta-phenylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-
10 hexylfluorentriphenyl phosphonium salt and 0.27g (2 mmol) of
isophthalaldehyde were polymerized by the same method as in
Example 1, and as a result, 0.69g of the titled polymer was
obtained as a pale yellow solid. The weight average molecular
weight and the molecular weight distribution were 43,500 and
15 4.12, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.2(br, m, aliphatic),
6.5-7.8(br, m, vinyl and aromatic)].

Example 12:

Synthesis of poly(9-normal-hexyl-2,7-fluorendiylvinylene
-alt-2,6-pyridinylene vinylene)

1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-
hexylfluorene triphenyl phosphonium salt and 0.27g (2 mmol) of
2,6-pyridinedicarboxaldehyde were polymerized by the same method
as Example 1, and as a result, 0.66g of the titled polymer was
25 obtained as yellow solid. The weight average molecular weight and

the molecular weight distribution were 20,800 and 5.10, respectively. [¹H-NMR (CDCl₃), δ 0.7-2.2(br, m, aliphatic), 3.7-3.9(br, s, fluorene-CH), 6.6-7.8(br, m, vinyl and aromatic)].

5 Example 13:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-2,6-pyridinylene-vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexyl-fluorene triphenyl phosphonium salt and 0.27g (2 mmol) of 2,6-pyridinedicarboxaldehyde were polymerized by the same method as in Example 1, and as a result, 0.68g of the titled polymer was obtained as a light yellow solid. The weight average molecular weight and the molecular weight distribution were 35,700 and 3.33, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.2(br, m, aliphatic), 6.6-7.8(br, m, vinyl and aromatic)].

Example 14:

Synthesis of poly[(9-normal-hexyl-2,7-fluorenediylvinylene -alt-2,2'-(N,N'-dipyrrolemethanylene vinylene)]

20 1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-hexyl fluorene triphenyl phosphonium salt and 0.40g (2 mmol) of N,N'-dipyrrolemethane-2,2'-dicarboxaldehyde were polymerized by the same method as in Example 1, and as a result, 0.78g of the titled polymer was obtained as a yellow solid. The weight average molecular weight and the molecular weight distribution

were 3,500 and 1.75, respectively. [$^1\text{H-NMR}$ (CDCl_3), δ 0.7-2.0(br, m, aliphatic), 3.6-3.8(br, s, fluorene-CH), 5.4-5.8(br, d, pyrrole-CH), 6.0-7.8(br, m, vinyl and aromatic)].

5 Example 15:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-2,2'-(N,N'-dipyrrolemethanylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexyl
fluorene triphenylphosphonium salt and 0.40g (2 mmol) of
10 N,N'-dipyrrolemethan-2,2'-dicarboxaldehyde were polymerized by
the same method as in Example 1, and as a result, 0.85g of the
titled polymer was obtained as a yellow solid. The weight
average molecular weight and the molecular weight distribution
were 8,100 and 2.03, respectively. [$^1\text{H-NMR}$ (CDCl_3), δ 0.4-2.1(br,
15 m, aliphatic), 5.5-5.8(br, d, pyrrole- CH_2), 6.1-7.8(br, m, vinyl
and aromatic)].

Example 16:

Synthesis of poly(9-normal-hexyl-2,7-fluorenediyl
20 vinylene-alt-2,5-furanylene vinylene)

1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-hexyl
fluorene triphenylphosphonium salt and 0.25g (2 mmol) of
2,5-furandicarboxaldehyde were polymerized by the same method as
in Example 1, and as a result, 0.62g of the titled polymer was
25 obtained as an orange-colored solid. The weight average

molecular weight and the molecular weight distribution were 20,200 and 4.35, respectively. [$^1\text{H-NMR}$ (CDCl_3), δ 0.6-2.2(br, m, aliphatic), 3.8-4.0(br, s, fluorene-CH), 6.2-7.8(br, m, vinyl and aromatic)].

5

Example 17:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-2,5-furanylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexyl
10 fluorene triphenylphosphonium salt and 0.25g (2 mmol) of
2,5-furandicarboxaldehyde were polymerized by the same method as
in Example 1, and as a result, 0.58g of the titled polymer was
obtained as a dark yellow solid. The weight average molecular
weight and the molecular weight distribution were 9,600 and 1.78,
15 respectively. [$^1\text{H-NMR}$ (CDCl_3), δ 0.5-2.1(br, m, aliphatic),
6.2-7.8(br, m, vinyl and aromatic)].

Example 18:

Synthesis of poly(9-n-hexyl-2,7-fluorenediylvinylene
20 -alt-2,5-thiophenylene vinylene)

1.92g (2 mmol) of 2,7-bis(bromomethyl)-9-normal-hexyl
fluorene triphenyl phosphonium salt and 0.28g (2 mmol) of
2,5-thiophendicarboxaldehyde were polymerized by the same method
as in Example 1, and as a result, 0.62g of the titled polymer was
25 obtained as a dark orange colored solid. The weight average

molecular weight and the molecular weight distribution were 9,300 and 3.89, respectively. [¹H-NMR (CDCl₃), δ 0.6-2.2(br, m, aliphatic), 3.7-4.0(br, s, fluorene-CH), 6.4-7.8(br, m, vinyl and aromatic)].

5

Example 19:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-2,5-thiophenylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexyl 10 fluorene triphenylphosphonium salt and 0.28 g (2 mmol) of 2,5-thiophenedicarboxaldehyde were polymerized by the same method as in Example 1, and as a result, 0.68g of the titled polymer was obtained as a dark yellow solid. The weight average molecular weight and the molecular weight distribution were 5,600 and 1.73, 15 respectively. [¹H-NMR (CDCl₃), δ 0.3-2.1(br, m, aliphatic), 6.4-7.7(br, m, vinyl and aromatic)].

Example 20:

Synthesis of poly(9-normal-hexyl-2,7-fluorenediylvinylene -alt-3-hexyl-2,5-thiophenylene vinylene)

1.75g (2 mmol) of 2,7-bis(bromomethyl)fluorene 20 triphenylphosphonium salt and 0.45g (2 mmol) of 3-hexyl-2,5-thiophenedicarboxaldehyde were polymerized by the same method as in Example 1, and as a result, 0.58g of the titled 25 polymer was obtained as a red solid. The weight average

molecular weight and the molecular weight distribution were 8,600 and 3.43, respectively. [¹H-NMR (CDCl₃), δ 0.8-1.8(br, m, aliphatic), 2.4-2.7(br, s, thiophene-CH₂), 3.7-4.0(br, s, fluorene-CH₂), 6.4-7.8(br, m, aromatic)].

5

Example 21:

Synthesis of poly (9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-3-hexyl-2,5-thiophenylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-
10 -hexylfluorene triphenylphosphonium salt and 0.45 g (2 mmol) of
3-hexyl-2,5-thiophenedicarboxaldehyde were polymerized by the
same method as in Example 1, and as a result, 0.64g of the titled
polymer was obtained as a red solid. The weight average
molecular weight and the molecular weight distribution were 8,200
15 and 1.95, respectively. [¹H-NMR (CDCl₃), δ 0.6-3.0(br, m,
aliphatic), 6.5-7.8(br, m, vinyl and aromatic)].

Example 22:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl
20 vinylene-alt-5,5'-dithiophenylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-
hexylfluorene triphenylphosphonium salt and 0.44g (2 mmol) of
2,2'-dithiophene-5,5'-dicarboxaldehyde were polymerized by the
same method as in Example 1, and as a result, 0.62g of the titled
polymer was obtained as a red solid. The weight average
25

molecular weight and the molecular weight distribution were 14,600 and 2.52, respectively. [¹H-NMR (CDCl₃), δ 0.6-2.2(br, m, aliphatic), 6.6-7.8(br, m, vinyl and aromatic)].

5 Example 23:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-1,4-di-normal-hexyloxy-2,5-phenylene vinylene) 2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexylfluorene triphenylphosphonium salt and 0.66g (2 mmol) of 1,4-di-normal-hexyloxyphenylene-2,5-dicarboxaldehyde were polymerized by the same method as in Example 1, and as a result, 0.98g of the titled polymer was obtained as an orange-colored solid. The weight average molecular weight and the molecular weight distribution were 13,500 and 3.05, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.2(br, m, aliphatic), 4.0-4.3(br, s, OCH₂), 6.7-7.8(br, m, vinyl and aromatic)].

Example 24:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-2,2'-diphenyletherylene vinylene) 2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexylfluorene triphenylphosphonium salt and 0.45g (2 mmol) of bis(2-formylphenyl)ether were polymerized by the same method as in Example 1, and as a result, 0.68g of the titled polymer was obtained as a pale yellow solid. The weight average molecular

weight and the molecular weight distribution were 18,500 and 3.52, respectively. [¹H-NMR (CDCl₃), δ 0.5-2.1(br, m, aliphatic), 6.7-7.9(br, m, vinyl and aromatic)].

5 Example 25:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-4,4'-(2,2'-dimethoxy-1,1'-(hexamethylene-1,6-dyloxy)diphenylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexylfluorene triphenylphosphonium salt and 0.77g (2 mmol) of 1,6-bis(4-formyl-2-methoxyphenoxy)hexane were polymerized by the same method as in Example 1, and as a result, 1.08g of the titled polymer was obtained as a yellow-green solid. The weight average molecular weight and the molecular weight distribution were 8,200 and 2.51, respectively. [¹H-NMR (CDCl₃), δ 0.3-2.1(br, m, aliphatic), 3.6-4.2(br, m, OCH₂), 6.4-7.7(br, m, vinyl and aromatic)].

Example 26:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl vinylene-alt-2,2'-(1,1'-(hexamethylene-1,6-diyloxy)diphenylene vinylene)

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal-hexylfluorene triphenylphosphonium salt and 0.65g (2 mmol) of 1,6-bis(2-formylphenoxy)hexane were polymerized by the same

method as in Example 1, and as a result, 0.85g of the titled polymer was obtained as an apricot-colored solid. The weight average molecular weight and the molecular weight distribution were 4,500 and 1.79, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.0(br, m, aliphatic), 3.9-4.1(br, s, OCH₂), 6.6-7.7(br, m, vinyl and aromatic)].

5 Example 27:

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl
10 vinylene-alt-3,3'-(1,1'-(hexamethylene-1,6-diyloxy)diphenylene
vinylene)

Polymerization of 2,7-bis(bromomethyl)-9,9'-di-normal
-hexylfluorene triphenyl phosphonium salt and 1,6-bis(3-formyl
phenoxy)hexane 2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-
15 normal-hexylfluorenetriphenyl phosphonium salt and 0.65g (2 mmol)
of 1,6-bis(3-formylphenoxy)hexan were polymerized by the same
method as in Example 1, and as a result, 0.88g of the titled
polymer was obtained as a light yellow solid. The weight average
molecular weight and the molecular weight distribution were 9,800
20 and 2.23, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.0(br, m,
aliphatic), 3.9-4.1(br, s, OCH₂), 6.5-7.7(br, m, vinyl and
aromatic)].

25 Example 28:

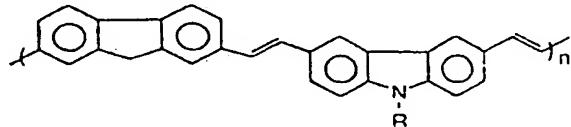

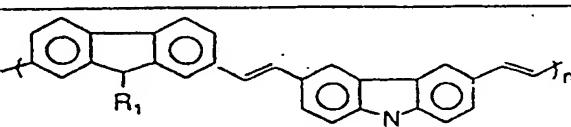

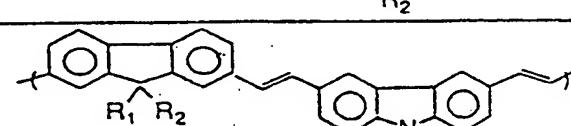

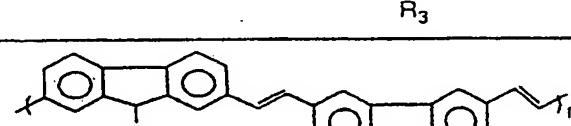

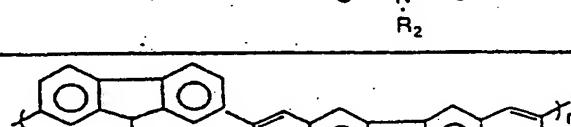

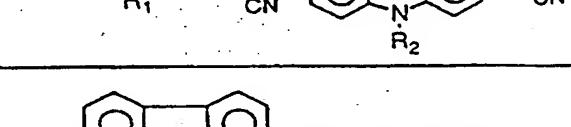

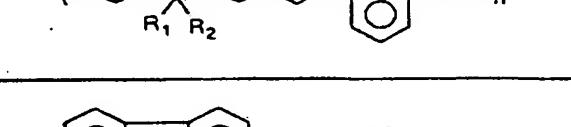

Synthesis of poly(9,9'-di-normal-hexyl-2,7-fluorenediyl

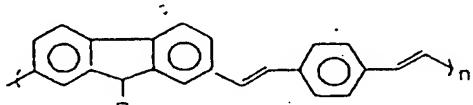

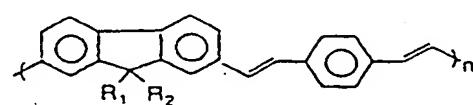

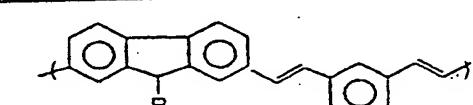

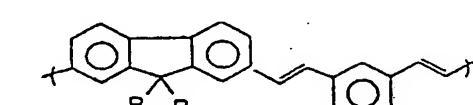

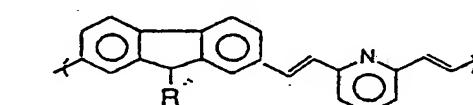

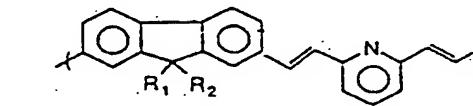

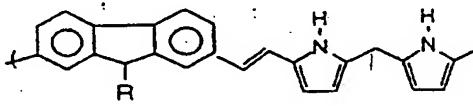

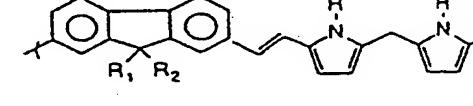

vinylene-alt-4,4'-(1,1'-(hexamethylene-1,6-diyoxy)diphenylene
vinylene)

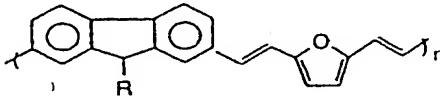

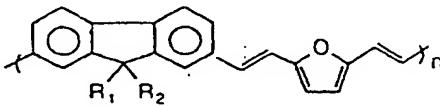

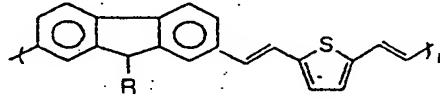

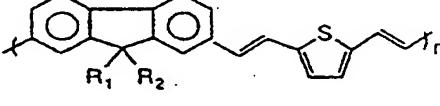

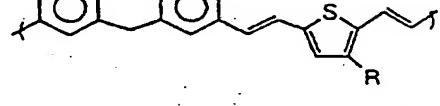

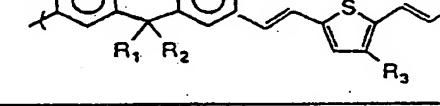

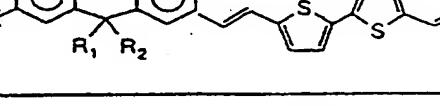

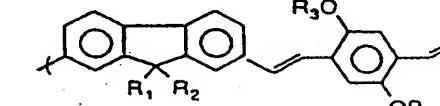

2.09g (2 mmol) of 2,7-bis(bromomethyl)-9,9'-di-normal
-hexylfluorene triphenylphosphonium salt and 0.65g (2 mmol) of
5 1,6-bis(4-formylphenoxy)hexane were polymerized by the same
method as in Example 1, and as a result, 0.86g of the titled
polymer was obtained as a yellow solid. The weight average
molecular weight and the molecular weight distribution were 6,800
and 1.68, respectively. [¹H-NMR (CDCl₃), δ 0.4-2.1(br, m,
10 aliphatic), 3.8-4.1(br, s, OCH₂), 6.6-7.7(br, m, vinyl and
aromatic)].

The structures of polymers manufactured according to the
Examples are shown in the following Table 1, and the nuclear
magnetic resonance spectra of the proton and carbon-13
15 manufactured according to Example 11, are shown in Figs. 1 and 2,
respectively.

Table 1. Chemical Structures of Polymers

Ultraviolet (UV), photoluminescence (PL) and
electroluminescence (EL) characteristics and manufacture of EL
elements

The UV, PL and EL spectra were obtained from thin films
using the thusly manufactured polymers, and EL elements were also
formed, and studies on the characteristics thereof were

conducted. Such thin film was formed by dissolving 0.1g of the polymer in 5ml of chloroform solution, refining it using a 0.2 micron filter, and then spin coating it, with the spin speed controlled appropriately to make the thickness of such film be
5 100 nanometers (ordinarily 900 - 1200 rpm).

After drying the coated sample at room temperature, the UV spectrum was first obtained, and then the PL spectrum was obtained using the maximum value of the UV peak. The obtained results are summarized in the following Table 2:

10

Table 2. Characteristics of Polymers manufactured according to
Examples

Ex.	UV (λ_{max} nm)	PL (λ_{max} nm)	T_{deg}^* (°C)
1	406	470, 492	212.1
2	408	470	216.5
3	408	466	216.8
5	420	558, 496	314.9
6	382	428, 448	414.4
7	412	480	420.1
8	406	490, 564	414.0
10	368	453	405.7
12	386	551	411.8
13	388	495, 530	421.8
14	392	466	378.2
15	398	467	403.8
23	444	509, 547	383.1
24	368	425, 445	410.4
25	388	458	397.8
26	374	429, 449	408.9
27	380	420, 441	416.9
28	386	447	410.0

* T_{deg} is the temperature from which a decomposition of the polymer begins in a thermal gravimetric analysis.

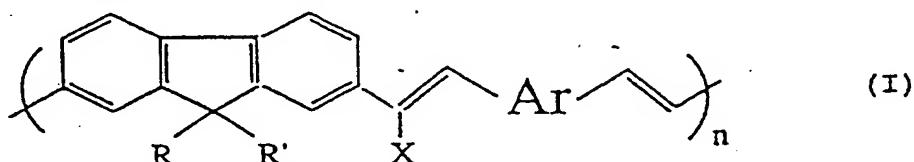

As shown in Table 2, it seems that the said polymers emit light of various color tones depending on the kinds of polymer, considering the fact that such polymers show the PL peak maximum values (420 - 564 nanometers) in a broad area. The actual spectra thereof are shown in Figs. 3-1 to 3-21.

An element consisting of the most generally used ITO / luminescent layer / electrode was made to study the EL characteristics. In this case, as the luminescent layer that was used was the polymer manufactured according to the Examples, or those obtained by blending macromolecules for general use, as described in the present invention, for example, such as polyvinylcarbazole, polymethylmethacrylate, polystyrene, epoxy resin, etc., with the polymers of the present invention, in the present of the chloroform solvent, and as for the material for the electrodes, aluminum was selected. The elements were formed by a vacuum deposition of aluminum on a luminescent layer spin-coated to 100 nanometers on the ITO glass substrate, in the same manner as in the sample manufacturing method for measurement of the UV or PL spectrum. In order to find out the voltage/current characteristics of such EL elements, the variation of current was measured by changing the voltage from -10V to 20V or more if necessary. As shown in Figs. 4-1 to 4-8, a critical voltage of between 10V to 20V was generally formed in the polymers of the present invention, which signifies that electroluminescence is produced at a voltage higher than such

critical voltage. The voltage-electroluminescence characteristics are shown in Figs. 5-1 to 5-4. For the purpose of analyzing electroluminescent light, the spectrum of light emitted through the ITO glass surface was measured by a 5 spectroscope, and the luminescent color tones were defined by the wavelengths representing the maximum luminescence. The electroluminescent spectra are shown in Figs. 6-1 to 6-4. The light emitting spectra produced by blending various polymers manufactured according to the Examples with the macromolecules 10 for general use, the voltage-current and voltage-electroluminescence characteristics, and the electroluminescent spectra emitted from elements, are shown in Figs. 7-1 to 7-7, and Figs. 8-1 to 8-6, respectively. The constitution of elements used in the present invention is shown 15 schematically in Fig. 9.

CLAIMS:

1. A fluorene-based alternating copolymer used for luminescent materials of electroluminescent elements, indicated
5 by the following formula (I):

where R and R' which are identical or different, are
10 selected from the group consisting of hydrogen, aliphatic or alicyclic alkyl or alkoxy groups containing 1 to 22 carbon atoms, or aryl or aryloxy group containing 6 to 18 carbon atoms, such as methyl, ethyl, propyl, isopropyl, butyl, isobutyl, pentyl, hexyl, ethylhexyl, heptyl, octyl, isoctyl, nonyl, decyl, dodecyl, hexadecyl, octadecyl, docodecyl, cyclopropyl, cyclopentyl, cyclohexyl, methoxy, ethoxy, butoxy, hexyloxy, methoxyethoxyethyl, methoxyethoxyethoxyethyl, phenyl, phenoxy, toyl, benzyl, naphthyl and anthracene groups, etc.;

15

X represents hydrogen or a cyano group;

20 Ar represents compounds substituted from aliphatic or alicyclic alkyl groups containing 1 to 22 carbons, phenyl groups in ortho, meta or para position, or aliphatic or alicyclic alkyl or alkoxy groups containing 1 to 22 carbons, such as alkyl, alkoxy, dialkyl and dialkoxyphenyl groups; diphenyl, 25 diphenylether, diphenylsulfide and diphenylamine compounds of

various isomers, compounds having two or more phenyl groups, such
as fluorene, terphenyl, naphthalene, anthracene, and derivatives
thereof, compounds having hetero atoms, such as pyridine, furan,
thiophene, alkylthiophene, dithiophene, pyrrole, dipyrrole,
5 dipyrrolemethane, dibenzofuran, dibenzothiophene,
diphenyloxadiazole, diphenylthiadiazole, carbazole, and
derivatives thereof, diphenylmethane or diphenylsilane compounds,
and bisformylphenoxyalkane or alkoxy compounds; and

n represents an integer greater than or equal to 1.

10 2. An electroluminescent element consisting of
anode/luminescent layer/cathode or anode/hole transporting
layer/luminescent layer/electron transporting layer/cathode,
characterized in that a light emitting materials of the
15 luminescent layer is a fluorene-based alternating copolymer of
formula (I) according to claim 1.

20 3. The electroluminescent element according to Claim 2,
characterized in that the light emitting materials of the
luminescent layer are materials in which the fluorene-based
alternating copolymer having the formula (I) according to claim
1 and macromolecules for general use are blended together.

25 4. The electroluminescent element according to Claim 3,
characterized in that the macromolecules for general use are

selected from the group comprising of polyvinylcarbazole, polymethylmethacrylate, polystyrene and epoxy.

5. The electroluminescent element according to Claim 3,
characterized in that the fluorene-based alternating copolymer
having the formula (I) is blended in the amount of 0.1 to 99.9
weight % based on the amount of the macromolecules for general
use.

10 6. A fluorene-based alternating copolymer used for
luminescent materials according to any one of the Examples.

7. An electroluminescent element incorporating in a
luminescent layer a light emitting material comprising a
fluorene-based alternating copolymer according to claim 6.
